Chain speed	13-14m/min
Chain length/Size	580m
Quantity of hand molds	5800pcs
Product qualification rate	99%
Possible products for the production line	Nitrile gloves/latex gloves
Heating method	Natural gas
Production line type/mode	single mold
Natural gas	About 80 m <sup>3</sup> / h
Water	About 4 m <sup>3</sup> / h
Electricity	About 90 kw/h
Nitrile latex	About 1.8 tons/day

### Labor Requirement:

8 In Total

DUTY	Number of People
Vulcanization	2
Operators	4
Mechanicals	1
Technician	1

### The characteristics of nitrile/latex glove machine:

1. Adopt the advanced secondary impregnation technology.
2. Can produce thin products with different weight, also can produce thick products for household.
3. PU coating technology and chlorine treatment technology can be used.
4. According to the lengths of the chains, 1-3 main engines can be used for operating.
5. Advanced chain and track structure ensures the stable operation under a high speed.
6. Vertical hot air circulation is used in the drying oven. Compared with other forms of hot air circulation, energy consumption can be saved by nearly 20%.

1. DELIVERY TIME: Two shipments within 3 months after receiving the deposit.
2. DELIVERY PLAN:
  - ① The first shipment (Machine Frames, Tanks, Electrical Appliances, Thermal Insulation, Auxiliary Equipment etc.) will send to buyer around 45 days after the seller party receives the deposit.
  - ② The second shipment (Glove Molds, Chains, Mold Holders etc.) will send to buyer around 45 days after first shipment send out.
3. PACKAGING: No packaging
4. CONTAINER: Shipped by FCL, about 10\*40'HQ.
5. INSTALL SERVICE:

Seller party will send 1 engineer to buyer's factory after the buyer part receives the first shipment, to guide and help them install the gloves machine. Meanwhile, buyer need offer 8~10 experienced workers for machine installation. After finishing the installation, seller party will send 1 chemical engineer to buyer's factory to teach the workers how to produce gloves.

The seller party will provide 2 months of free installation and commissioning services. If it exceeds 2 months, the buyer party will pay 120USD/day for each engineer. All related expenses (Includes flight tickets, accommodations etc.) during engineers' business trip will be provided by the buyer.

Notice: All parameters provided below are for reference only. Actual field installation Should be subject to specific production line.

EQUIPMENT SPECIFICATION		
1. 	Chain Model	Chains are the life of the production line. Every single process of the production line is driving by chains. Different production lines use different driving chains, ours uses 100mm pitch chain. The main purpose is to reduce the wear, noise and ensure the smooth operation. We also use gravity tensioning system to make sure the chain is tightened at all times.
2.	Frame Material and Technical Requirements

		<p>The main structural frame uses high-carbon steel material, strong and durable. The main frame of the beam structure uses high-carbon steel type: 10*10 square tube. The main and sub track also uses high-strength, wear-resistant high-carbon steel materials: 5# U-shaped steel, 12# C steel and etc. combined as the main transmission track of the production line. Make sure to proceed protective process after finishing installing the main rack. Coating with anti-rust paint as a start, to prevent rust and corrosion; Then paint with a layer of smooth finish, one is to strengthen the protective effect, second is to remain a good looking. According to different processes, the temperature resistance of high temperature paint should be in 150-200°C range. (Also depend on customer's request)</p>
	Main drive and Auxiliary Drive	<p>The main drive for various production lines is driven by 18.5KW motor and flanged helical gears and such. This type of motor follows 3C standard for it is not easy overheating and also for the effective and longtime running. The combination of flanged helical gear drives makes sure the main drive running steadily.</p>

	Coagulator Tank, Material Tank Specifications and Technical Requirements and Functions:	<p>Auxiliary Driving Equipment: Includes mold brushing system; Coagulator circulation system; Sulfide mixture (Latex, Nitrile and etc.) stirring system; Starch circulation system; Heat transmission and distribution system; Angular rotation system and etc.</p> <p>The structures of coagulator tank and material tank are formed with inner and outer two layers. Both of two layers use 3mm 304 stainless steel. This type of stainless steel has an even heat condensation and a good corrosion resistance. Heat condensation helps keep the temperature of the coagulator tank and latex tank. Coagulator Tank and Material Tank has circulating stirring system. Motor drive and stainless-steel vane circulating works together as material circulation system. This type of motor does not over heat easily and has a long operating time, and brings a steady circulation for coagulator tank and material tank. The stainless-steel vane circulation pump has a good corrosion resistance, and it is hard to wear, won't create any metal powder to contaminate coagulator and materials.</p>

		<p>Most of the double layered tanks on the production line are using built-in heating coil. Through the use of coils to heat the water inside of the interlayer, and use water temperature to control the temperature of the fluid in the tank. This method can avoid the qualitative change brought by the direct heating.</p>
5	 <p>Specification and Function of Mold Cleaning Units: 1 Acid Tanks, 1 Alkaline Tanks, 1 Hot Water Tanks</p>	<p>Mold cleaning unit includes acid bath, alkaline bath, disc brush cleansing mechanism and horizontal brush cleansing mechanism and also a hot water tank. All of these tanks are single layered, made of 3mm 304 stainless steel, can be directly heated.</p> <p>They are all customizable for specific crafting needs; As for the disc brush and horizontal brush, they are made of engineering plastic material and nylon.</p> <p>Each tank of this system has its own function. Acid bath is to clean the residue off of the molds; Alkaline bath is to neutralize the acids remained on the molds; then enter</p>

		<p>cleansing mechanisms to make molds back to initial condition; In the end, molds will be soaked into hot water tanks to clean off the dust to achieve further cleanness. As for the heating method, our production line uses heating coil. By putting the coil at the bottom of the tank and using heat-dissipating method to heat the cleansing fluid, then to achieve the best constant temperature effect.</p>
	Structure and Function of Leaching Tanks	<p>①: Leaching tanks are made of 3mm 304 stainless steel plates which have an even heat condensation and a good corrosion resistance. ②: The leaching tanks are to help clean the protein off of the products, also to preheat.</p>
	Structure and Function of Starch Tank	<p>①: The starch tank is a single layered tank. It is made of 3mm 304 stainless steel. ②: Based on different crafting processes, the primary role of the starch tank is to help attach isolation powder to the surface of the product to make finished products not stick to each other after stripping.</p>

		③: Place the heating coil at the bottom of the starch tank to heat it directly.
<p>8</p>  <p>Edge Curling, Flanging and Automatic Demolding System</p> 		<p>①: The curling system is made up of various components and mechanical working principles.</p> <p>②: And the flanging system, also called pre-demold system, is relatively simple. Its function is to help the stripper machine to run. It is similar to crimping function, and the structure is circular brush shaft made of nylon.</p> <p>③: Throughout the whole production line, auto demold system has the most complex process. Based on different crafting process and different products, such as demolding clamp, plywood, roller, disc brush roller and compressed air, and different materials, the structure of demolding process is not quite the same as well. The main function for this system is to reduce labor use, increase working efficiency and boost the production.</p>

<p>9</p> 	<p>Auxiliary Equipment for Chemical Process</p>	<p>①: Chemical Process Auxiliary Equipment, mainly used for grinding, formulating, vulcanizing, producing and adding chemicals. Mainly includes diaphragm pump, ball mill, sand mill, vulcanizing stirring tank, storage tank, color mixing tank, feeding tank, coagulant stirring tank, polymer stirring tank, starch stirring tank. Different production line should choose different chemical process auxiliary equipment to operate.</p> <p>②: Sand mill is for grinding chemical granules into fine powder. Sand mill comes with steel balls, and use stirring method to grind chemicals.</p> <p>③: Vulcanization stirring tank, storage tank, polymer stirring tank, coagulant stirring tank, starch stirring tank and feeding tank mainly used to mix and adjust to produce the finished chemicals. Through well stirring to mix chemicals and to prevent sediment. Suitable processing method should be chose based on different processing needs.</p> <p>④: Chemical auxiliary tanks mostly use two-layers constant temperature tank. Inner layer uses 3mm 304 stainless steel plate as the material, with even heat accumulation and corrosion prevention effect. Outer layer use 4mm high-carbon steel plate. High strength steel plate can enhance the structure of the tank body, and prevent it from deformation.</p>

		<p>⑤: Stirring system uses cycloid pin reducer and transducer to control. Based on different chemical process needs, the stirring speed needs to be changed as well. Agitating blades are helical blades made of 304 stainless steel.</p>
10	 <p>Oven Insulation Board Specifications and Technical Parameters:</p>	<p>①: Drying Oven forms with several isolated ovens separated by insulation boards. Sizes of the small oven should decide according to different processing needs. The main function of the drying oven is to provide heat accumulation space and to dry the products. Operating temperature is also alternated from 80-110°C, 110-130°C, 130-150°C, depend on different processing needs.</p> <p>②: Drying Oven has a good insulation effect and high temperature resistance up to 250-300°C. The heat preservation cotton in the interlayer has a solid density. Isolation boards are well compacted to avoid heat leakage, and to reduce heat loss.</p>

Isolation boards are well compacted to avoid heat leakage, and to reduce heat loss.</p> <p>③: There are several doors over 4 sides of drying oven for maintenance and observation.</p>
11.	 <p>Oven Heat Conducting Equipment and Dehumidification Exhaust System:</p>	<p>①: The main heat conduction device of drying oven uses conduction oil, steam, hot air with radiation pipe, box-type radiator to transport the heated air, also exhaust the moisture out of the oven. There are several 20mm*40mm evaporation gate for every 10m on the top of the oven to help deal with the humidity to keep the oven dry, and to reduce the corrosion caused by moisture.</p>
